                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Details of S. coelicolor sequences

Details of S. coelicolor sequences

available on the World Wide Web.

(URL; http://www.sanger.ac.uk/Projects/S_coelicolor/) CDS are

numbered using the following system eg SC7B7.01c. SC (S.

coelicolor), 7B7 (cosmid name), .01 (first CDS), c (complementary

coelicolor), 7B7 (cosmid name), .01 (first CDS), c (complementary)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene parediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at
                                                                                                                                                                                                                                                                                                                                            http://www.nih.go.jp/
jun/cgi-bin/frameplott.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the movement of the codon of the codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (25-NOV-1997) Streptomyces coelicolor sequencing project, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA E-mail: barrell@sanger.ac.uk Cosmids supplied by Prof. David A. Hopwood, [3] John Innes Centre, Norwich Research Park, Colney, Norwich, Norfolk NR4 7UH, UK
                                                                                                                                                               IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for small overlap between neighbouring submissions. Cosmid 7B7 is the AseI-B fragment, between 7H1 and 1C3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Kinashl,H. and Hopwood,D.A.
A set of ordered cosmids and a detailed genetic and physical map for the 8 Mb Streptomyces coelicolor A3(2) chromosome Mol. Microbiol. 21 (1), 77-96 (1996)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Streptomyces coelicolor sequencing at The Sanger Centre is funded by the {\tt BBSRC}.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Parkhill, J., Barrell, B.G. and Rajandream, M.A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Murphy, L.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptomyces coelicolor A3(2).

  'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein'. The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/Grail-1.3/), GENSCAN (Chris Burge, MIT, http://cCR-081.mit.edu/GENSCAN.html), NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of penmark, http://www.cbs.dtu.dk/services/NetGene2/) and splicePredictor (Volker Brendel, Stanford University, http://gremilnl.zool.iastate.edu/cgi-bin/sp.cgi). Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Mashington University School of Medicine, St. Louis, http://gremme.wistl.edu/ddiv/thascan-SE (Sean Eddy, Mashington University School of Medicine, St. Louis, http://gremme.wistl.edu/ddiv/thascan-SE (Sean Eddy, Mashington University School of Medicine, St. Louis, http://gremme.wistl.edu/ddiv/thascan-SE (Sean Eddy, Mashington University School of Medicine, St. Louis, http://gremme.wistl.edu/ddiv/thascan-SE (Sean Eddy, Mashington University School of Medicine, St. Louis, http://gremme.wistl.edu/ddiv/thascan-SE (Sean Eddy, Mashington University School of Medicine, St. Louis, http://gremme.wistl.edu/ddiv/thascan-SE (Sean Eddy, Mashington University School of Medicine)

Genes with similarity to proteins in the databases are described in 
'product' or 'note' qualifiers. Genes that have no significant 
protein similarity are described as 'unknown protein'.

The software programs used to predict genes include: Grail 
(Informatics Group, Oak Ridge National Laboratory, 
http://compbio.ornl.gov/Grail-1.3/),

GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html), 
MetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of 
Denmark, http://www.cbs.dtu.dk/services/MetGene2/) and 
SplicePredictor (Volker Brendel, Stanford University, 
http://gremlinl.zool.iastate.edu/cgi-bin/sp.cgi).

Genes encoding tRNAs are predicted by tRNAscan-SE 
(Sean Eddy, Washington University School of Medicine, St. Louis, 
http://grown.cst.de/grown.cst

  IMPORTANT: This sequence is not the entire insert of clone RP11-22L21 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true left end of clone RP1-21F7 is at 114422 in this sequence. The true right end of clone RP3-417022 is at 100 in this sequence.

  sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Lw-pass sequence sampling is useful for
   identifying clones that may be gene-rich and allo
overlap relationships among clones to be deduced
   bе
  However,
   NOTE: This record contains 141 individual
  will be sequenced to completion. In the event that
  the record

   The present sequence is the coding sequence of the human prostate cancer predisposing gene HPC2, which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer.

The present sequence encodes human sulphatase 6 (1150). 130 Ls not a member of the well-characterised CTPER sulphatase family. It belongs to a family showing sequence similarity to a sulphatase from the marine bacterium Alteromonas carrageenovora. The hSG gene contains 23 exons and is located at chromosome 17pll.2. The present sequence is clone lambda29.1 from a human testes CDNA library. It was isolated using human EST sequences with sequence similarity to the non-CTPSR family as a probe to screen the library. The CDNA insert was subcloned and the DNA sequence of both strands was determined. The sequence may be used to treat a patient suffering from hSG deficiency by replacing, repairing, or compensating for a DNA sequence within the patient's genome.
   Novel isolated DNA seque fragment useful in gene sulfatase deficiency

  immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antinungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The
  antianaemic; gene therapy; cancer; proliferative disorder; hypertension; neurodegenerative disorder; osteoarthritis; graft vs host disease; cardiovascular disease; diabetes mellitus; hypothyroidism; SCID, AIDS; cholesterol ester storage; systemic lupus erythematosus; infection; severe combined immunodeficiency; malaria; autoimmune disorder; asthma; allergy; aplastic anaemia; nocturnal haemoglobinurla; burn; wound; bone damage; cartilage damage; antiinflammatory disease; coagulation;
   vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, altoiamene disorders, asthma, altoiamene disorders.
  which represent the human ORFX open reading frames 1 to 3161. sequences have activities such as: cytostatic; hepatotropic; vantipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant;
   Novel nucleic acids and peptides derived from open reading useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -
   Sequence
   allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
  nucleic acids can be used to express ORFX proteins in gene therapy
  AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX

   The present sequence is the genomic sequence of the human prostate cancer predisposing gene HPC2, which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer.

  AAZ79917 to AAZ80766 represent double stranded cDNA clones isolated from the human colorectal adenocarcinoma (colon cancer) cell line SW480. The cDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. The cDNA clones can be used for developing agents for the diagnosis and treatment of

The present sequence is part of the coding sequence of a variant of the human prostate cancer predisposing gene HPC2, which is found on chromosome 17p. This variant has been designated 1641insG. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer, this allele being an example of this. The HPC2 gene and its protein can be used in peptide and gene therapy for cancer patients,

                          sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
   mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST
  Claim 1;

the global expression of genes from FF cells allows the production CC potential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be cC discovered, possible functions of unknown open reading frames can be cC monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore compined to changes in culture conditions, environmental stress, spore compined to changes including conditions, environmental stress, spore compined to the concept of the control of cancel to the control of the cancel to facilitate cancel to the control of the cancel to the control of the cont
  The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the

  sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopoisesis regulating activity, tissue growth activity, activity, activity, activity, activity, activity, activity, activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene
   The present sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to
  New polynucleotides encoding human secreted proteins - e.g. human blood, kidney, foetal lung, placenta, testes ovary, pituitary, retina and colon cDNA libraries

of Moraxella catarrhalis (Branhamella catarrhalis) 78. There are 3 tandem genes in locus, identified as lbpA, lbpB (alternative start codons) and orf3A, respectively encoding lactoferrin binding protein 2 (Lbp2, see AAW89417), lactoferrin binding protein 1 (Lbp1, see AAW89418) and open reading frame protein 3 (ORF3, see AAW89420). The lfr locus was identified following generation of a M. C. catarrhalis strain 78 genomic DNA library and screening with specific hybridisation probes. The genes and DNA sequences of the lfr locus are useful for diagnosis, immunisation, and the generation of diagnostic and immunological reagents. Immunogenic compositions, including vaccines, based upon expressed recombinant Lbpl and/or Lbp2 and/or ORF3, portions of these or their analogues, catarrhalis is a causative agent of diseases sused by Moraxella. M. catarrhalis is a causative agent of otitis media and has been associated with sinusitis, conjunctivitis and inflammatory diseases from their respiratory tract, such as pneumonia, chronic
   Lactoferrin receptor genes from Moraxella, especially M. catarrhalis - useful to diagnose Moraxella infection e.g. to detect otitis media due to M. catarrhalis infection and to immunise against such

   AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating blological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bloactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.

   insulin or leuprolide, but many other suitable therapeutic agents are disclosed, including genes or inhibitory nucleic acid, imaging agents and antigens. (I) may also provide targeting to the GI tract. Other uses of (I) are: (1) to determine the level of specified receptors in a sample (in a binding assay); and (ii) to screen for molecules that bind (I). Immunogenic analogues or derivatives of (I) are used to raise antibodies and in immunoassays. The antibodies are used to locate, detect and measure (I), e.g. for imaging, monitoring treatment, tissue analysis etc., also for peptide purification and immobilisation.
   gastro-intestinal (GI) tract receptors human intestinal peptide-associated transporter (HPTI), hPEPTI, D2H and human peptide-associated transporter (HPTI), provide active transport of sucrose-isomaltase complex (hSI). (I) provide active transport of therapeutic agents through human and animal GI tissue (into the bloc for in vivo delivery, particularly for treatment or prevention of hypertension, diabetes, osteoporosis, haemophilia, anaemia, cancer, migraine, or angina pectoris. Specifically they are used to deliver

   The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine

   cDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders involving unwanted cell proliferation, such as neoplasia,
   Novel nucleic acids, used to develop products: treatment of disorders involving unwanted cell particularly cancers, especially colon cancer

   /note-*Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NCI_CGAP_LU5 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1414920-1417991 and 1520904-1523439). Subtraction by Bento Soares and M. Fatima Bonaldo.

   Result
No.
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  SPACID4 31201 t
S.pombe chromosome
z69239
   overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.
Cosmid clD4 is overlapped at the 5' end by cosmid clF3 and at the
   (complementary strand).
The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous.
The length in codons is given for each CDS.
The length in codons is given for each CDS.
The length is sequence MAY NOT be the entire insert of the COMPORTANT: This sequence MAY NOT be the entire insert of the complement of the code of
  Lye,G., Churcher,C.M., Barrell,B.G., Rajandream,M.A. and Walsh,S.V. Direct Submission
Submitted (01-FEB-1995) Schizosaccharomyces pombe chromosome I sequencing project, Sanger Centre, Hinxton Hall, Hinxton, Cambridge CB10 1RQ E-mail: barrell@sanger.ac.uk
   byr1; cct2; CDP-alcohol phosphatidyltransferase; chaperonin; conjugation and sporulation; csk1; cyclin suppressing protein kinase; DNA repair helicase; golgi peripheral membrane protein; protein kinase; rad15; rhp3; serine threonine protein kinase; ste1; TCP1 beta subunit homologue; tf2 LTR.
  Cosmid clD4 is overlap
3' end by cosmid c22F3
  splice donor/acceptor sites.

CDS are numbered using the following system eg SPAC5H10.01c. SP Dombe), A (chromosome 1), c5H10 (cosmid name), .01 (first CDS),
   supplied by the program Sp3splice. CAUTION: It is possible that for any individual CDS we may have underestimated or overestimated the number of introns/exons or we may not have chosen the correct
   Protein coding regions (CDS) have been predicted with the help of computer analysis using the Genefinder program in PomBase (an ACEDB database) with additional predictions for the branch-acceptor sites
   Details of yeast sequencing at the Sanger Centre are available the World Wide Web.
  Eukaryota; Fungi; Ascomycota; Schizosaccharomycetes;
Schizosaccharomycetales; Schizosaccharomycetaceae;
  Schizosaccharomyces pombe
   sequenced clone.
  Notes
   Schizosaccharomyces.
  (URL, http://www.sanger.ac.uk/Projects/S_pombe)
   fission yeast.
  (bases 1 to 31201)
   /note="the sequence of this region is derived from cosmid c 1F3, the true end of c1D4 is at position 134, while the true end of c1F3 is at position 4137 in this sequence"

  Submitted (22-APR-1999) Drosophila Genome Center, Lawrence Berkeley Laboratory, MS 64-121, Berkeley, CA 94720, USA On Feb 24, 2000 this sequence version replaced gi:7018750. For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a 'working draft' sequence. It currently consists of 36 contigs. The true order of the pieces is not known and their order in this sequence record is
   Celniker, S.E., Agbayani, A., Arcaina, T.T., Baxter, E., Blazej, Butenhoff, C., Champe, M., Chavez, C., Chew, M., Ciesiolka, L., Doyle, C.M., Farfan, D.E., Galle, R., George, R.A., Harris, N.L., Hinkle, A., Hoskins, R.A., Houston, K.A., Hummasti, S.R., Karra, Kearney, L., Lee, B., Lewis, S., Li, P., Ling, H., Moshrefi, A.R., Moshrefi, N., Nixon, K., Pacleb, J.M., Park, S., Pfeiffer, B., Richards, S., Sethi, H., Svirskas, R.R., Wan, K.H., Webster, D., Woolley, P., Yang, S., Yee, M., Yu, C., and Rubin, G.M.

  CC AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, CC which represent the human ORFX open reading frames 1 to 3161 The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; continuous timulant; cardiant; thrombolytic; coagulant; vasotropic; cc antidiabetic; hypotensive; dermatological; immunosuppressive; antiparkinsonian; antivrthritic; immunosuppressive; cc antidiabetic; hypotensive; dermatological; immunosuppressive; cc antidiabetic; and antianaemic. The sequences can be used for determining cc the presence of or predisposition to, or preventing or treating cc the presence of or predisposition to, or preventing or treating cc nucleic acids can be used to express ORFX proteins in gene therapy cc vectors. The proteins and nucleic acids may be used to treat cancers, cc proliferative disorders, neurodegenerative disorders, osteoarthritis, cc profiferative disorders, neurodegenerative disorders, osteoarthritis, cc graft vs host disease, cardiovascular disease, diabetes mellitus, cc dispertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, cc allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, cc coagulation; to inhibit thrombosis; and as a contraceptive.

   The present sequence is the coding sequence of the human prostate cancer predisposing gene HPC2, which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic cools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer.
   Human prostate cancer (HPC)2 nucleic acids, polantibodies, useful for treatment and diagnosis

The present sequence encodes human sulphatase G (hSG). hSG is not a member of the well-characterised CTPSR sulphatase family. It belongs to a family showing sequence similarity to a sulphatase from the marine bacterium Alteromonas carrageenovora. The hSG gene contains 23 exons and is located at chromosome 17pl1.2. The present sequence is clone lambda29.1 from a human testes CDNA library. It was isolated using human EST sequences with sequence similarity to the non-CTPSR family as a probe to screen the library. The CDNA insert was subcloned and the DNA sequence of both strands was determined. The sequence may be used to treat a patient suffering from hSG deficiency

   The present sequence is the genomic sequence of the human prostate cancer predisposing gene HPC2, which is found on chromosome 17p. Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer.

                                 The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences clona the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Parters of and servertion vectors.

  The present invention provides methods of identifying antifungal agents using the coding and protein sequences of several yeast genes. These are essential for the germination and proliferation of Saccharomyces cerevisiae, and include YKR081C, YFR003C, YGR277C, YGR278W, YKR071C, YKR079C and YKR083C. The sequences can also be used to identify compounds for use as herbicides, insecticides and anti-proliferation drugs which can be used in the treatment of cancer, psoriasis and restenosis. This is because they can be used to identify plant, insect and human homologues of the west cancer.
  Identifying antifungal compounds which target yeast essential genes comprises use of novel Saccharomyces cerevisiae essential genes YFR003C, YGR277C, YGR278W, YKR0701C, YKR079C or YKR083C or YKR081C

wall synthesis by increase. Antibiotic Tel-aviv genes are userulipid disaccharide-pentapptide. Antibiotic Tel-aviv genes are userulin combinatorial genetics, and for encoding protein components for the synthesis, modification and regulation of antibiotic antibiotic Tel-aviv. Antibiotic Tel-aviv is useful in a wide range of clinical applications such as treating ginglythis. Antibiotic Tel-aviv is also useful for generating new biological agents from its secondary metabolites. The
   a functional portion of polypeptide component required for synthesizing the polyketide antibiotic Tel-Aviv, postmodification of antibiotic Tel-aviv or regulation of biosynthesis of antibiotic Tel-aviv is a macrocyclic polyketide synthesised through the incorporation of acetate, methionine, and glycine. It inhibits cell
  Novel DNA sequence involved in polyketide antibiotic Tel-Aviv production useful for inhibiting cell wall synthesis and in wide range of clinical applications such as treating gingivitis -

This invention describes a novel DNA sequence (I) that expresses product having the biological function of lipopeptide synthase. The invention also describes (I) recombinant expression vectors containing (I); (2) prokaryotic and eukaryotic cells transformed or transfected with (I) or the vector of (2); (3) production of lipopeptide synthases by culturing cells of (2); (4) expression products (II) of (I), and synthetic protein or peptides with the same sequences; (5) mono- or poly-clonal antibodies (Ab) specific for (II); (6) hybridoma cells that produce monoclonal Ab;
  New DNA encoding a bacterial lipopeptide synthase, useful opproducing antimicrobial agents, surfactants with increased bioavailability in microbial depollution methods, and trans

   and (7) transgenic plants that contain cells of (2). (I), and their fragments, are useful for expression of recombinant lipopeptide synthases, and as probes and primers for detection, isolation and amplification of full-length cDNA sequences. (I) are used to produce transgenic plants. Lipopeptide synthases are useful for production of antiviral, antibacterial or antifungal lipopeptides, particularly useful for treatment of plants, and for production of lipopeptide surfactants used for increasing bloavailability in microbial depollution processes used for increasing bloavailability in microbial depollution processes
